Differences; State Agencies; *State Government; State
Norms; State Programs; State Surveys; Tables (Data);
Tax Allocation; Taxes; Trend Analysis

ABSTRACT

This handbook is an easy-to-use reference book for policymakers, public officials, and policy analysts, as well as anyone else who may need up-to-date information about state economic, demographic, and fiscal data. The book includes data on demographics, poverty rates, per capita state personal income, state and local tax rates, and state and local government revenues and spending programs. Gender and age comparisons are noted in some instances. The book's main section consists of four-page summaries, one for each state, that highlight economic indicators, population and poverty measures, household income distribution percentages, and fiscal data. The second section gives users separate tables and selected maps for making state-by-state summary comparisons on a single item of information. A third section provides detailed notes on data sources. Contains 27 tables of data and 16 maps. (SLD)

Acknowledgments

The authors are grateful to the many individuals who contributed to this handbook. In particular, thanks are given to Jeff Katz for generating the summary ranking tables, to Sara Rix, John Gist, Susan Raetzman, and other AARP staff for their comments, and to Scott Mackey, Mark Gripentrog, and all other officials who took time from their busy schedules to review sections of the handbook. Special thanks also go to Grant Harris for his graphic design contribution, and to Robin Almen for her editorial work.

The Public Policy Institute, formed in 1985, is a part of the Division of Legislation and Public Policy of the American Association of Retired Persons. One of the missions of the Institute is to foster research and analysis on public policy issues of interest to older Americans. This publication is part of that effort.

Any views expressed herein are for information, debate, and discussion, and do not necessarily represent formal policies of the Association.

Introduction

This handbook is as an easy-to-use reference book for policymakers, public officials, and policy analysts, as well as anyone else who may need up-to-date information about state economic, demographic, and fiscal data. This book includes data on population, poverty rates, per capita state personal income, state and local tax rates, and state and local government revenues and spending programs. Gender and age comparisons are noted in several instances.

State and national comparisons as well as 10-year comparisons distinguish this handbook from many other reference books. Comparisons can be found for a variety of purposes. For example, per capita measures of tax revenues and percentage of state personal income measures for tax revenues can be used for comparing a state's tax burden with the national average. Other possible data, such as population, per capita state personal income, unemployment, and median household income can be used for state and national average comparisons.

The book is divided into three parts. The first part contains a four-page summary for each state that highlights economic indicators, population and poverty measures, household income distribution percentages, and fiscal data. Users interested in a particular state can go directly to this section and find a wealth of information that would otherwise have to be assembled from a variety of reference tables.

The economic indicators portion features gross economic measures of state personal income, median household income, gross state product, and employment. The population and poverty portion provides data on population and poverty rates by sex and age. The economic indicators and population data sections include 10-year and national comparisons; state and national poverty rates are provided for easy comparison.

Household income distribution data are by the age of the householder. State and national comparisons are provided.

The fiscal data are divided into two segments: state and local general revenue and tax rate data and state and local general expenditure and debt ratio measures. For state and local general revenues, calculations on per capita general revenue categories and the percent of state personal income in general revenue categories provide tax burden comparisons between each state and the national average. Tax rates are shown at the state level; where appropriate, local tax rates are described.

The state and local general expenditures segment features per capita and percent of personal income figures that allow for comparisons between each state and the national average. With these figures, comparisons can be made on how much is spent for education and other expenditure programs. State and local debt

information is provided on a per capita basis and per \$1,000 of personal income. The composition of short-term and long-term debt is also illustrated.

The second part of the handbook provides users with separate tables and selected U.S. maps for making state-by-state summary comparisons on a single item of information, such as per capita income, for all 50 states and the District of Columbia. The tables provide state rankings for easy comparisons. Since local governments can also, in many cases, levy taxes, tables showing direct comparisons between states and the national average were not shown.

Most of the information in this book comes from the U.S. Census Bureau. Additional sources include: the U.S. Bureau of Economic Analysis, the U.S. Bureau of Labor Statistics, and the District of Columbia Government. Detailed information on data sources can be found at the back of the handbook.

As state and local economic conditions and demographic patterns change, policymakers may have to adjust their policies on taxes and spending programs. These adjustments become more difficult when economic and demographic changes depart from historical trends. It is hoped that this handbook will contribute to more informed public policy decisions by identifying economic, demographic, and fiscal changes.

Requests for additional copies of this book should be directed to the Economics Team, Public Policy Institute, AARP, 601 E Street, N.W., Washington, DC 20049, or call (202) 434-3870.

Source Notes and Explanations

ECONOMIC INDICATORS

Median Household Income

Source: U.S. Department of Commerce, Economics and Statistics Administration, Bureau of the Census, Money Income of Households, Families, and Persons in the United States: 1991, Current Population Reports, Consumer Income, Series P-60, No. 180. Washington, DC, August 1992 and unpublished for 1981 data.

These data were collected from the Current Population Survey (CPS) conducted by the Bureau of the Census. The survey represents about 60,000 households nationwide. Income estimates are based on income before taxes and do not include noncash benefits, such as food stamps. Like most surveys, the household income data approximate actual household incomes.

Gross State Product

Source: U.S. Department of Commerce, Bureau of Economic Analysis (BEA) Survey of Current Business, December 1991.

Gross State Product (GSP) is the "market value of the goods and service attributable to labor and property located in a state. It is the state counterpart of the nation's gross domestic product" (Survey of Current Business, page 43, December 1991). The Bureau of Economic Analysis (BEA) prepares GSP estimates on an industry-by-industry basis. Per capita GSP equals total GSP divided by a state's population estimates as determined by the Bureau of the Census.

Personal Income and Employment

Sources: U.S. Department of Commerce, Bureau of Economic Analysis (BEA), Regional Economic Information System. Data are available on computer diskettes SA5 (personal income) and SA25 (number of part- and full-time positions). Personal Income data are also published by the U.S. Bureau of Economic Analysis, Survey of Current Business.

Personal income represents income from all sources, i.e., government and non-government. It consists of wage and salary disbursements, other labor income, proprietors' income, rental income of persons, personal dividend income, personal interest income, and transfer payments, less personal contributions for social insurance. Per capita income equals total state personal income divided by a state's population estimate from the Bureau of the Census.

Employment data represent the number of full- and part-time positions on an industry-by-industry basis. It is not the number of persons employed. Many people have more than one job; in such cases, the number of positions will exceed the number of employed

persons. The data include employers covered by unemployment insurance, military personnel, agricultural employees and self-employed persons. At the present time, BEA offers this information only on computer diskette or computer printouts.

Unemployment Rates

Source: U.S. Department of Labor, Bureau of Labor Statistics (BLS), Geographic Profile of Employment and Unemployment, annual and the Local Area Unemployment Statistics (LAUS) computer program.

Unemployment rates are based on the Current Population Survey (CPS), a nationwide survey of 60,000 households conducted by the Bureau of the Census for BLS. The unemployment rates are annual averages.

In most cases, estimates on unemployment rates for high-population states have less probability of error than low population states due to larger sample sizes. Unemployment rates reflect people, not including the military, without jobs who made an effort to find work. Discouraged workers and people working part-time but seeking full-time employment are not classified as unemployed.

Percentage Distribution of Household Income by Age of Householder

Source: U.S. Department of Commerce, Bureau of the Census, 1990 Census of Population and Housing Summary Tape File 3C available on CD-ROM.

Household income data are taken from the 17.7 million households that completed the long census form in the 1990 decennial census. The data are taken from 1989 household incomes.

DEMOGRAPHICS AND POVERTY RATES

Population by Age and Sex

Source: U.S. Dept. of Commerce, Bureau of the Census, Current Population Reports, Population Estimates and Projections, Series P-25, No. 1106.

The population data are annual estimates based on the decennial census data and not on any survey data.

Poverty Rate by Age and Sex

Source: U.S. Department of Commerce, Bureau of the Census, 1990 Census of Population & Housing, Summary Tape File 3C, available on CD-ROM.

Poverty data are taken from the 17.7 million households that completed the long census form in the 1990 decennial census. The poverty data are based on 1989 household incomes.

FISCAL AND TAX RATE DATA

State/Local Revenues and Expenditures and Debt Ratios

Source: U.S. Department of Commerce, Bureau of the Census, Government Finances, 1990-91.

The U.S. Bureau of the Census annually conducts surveys of state and local government finances on revenues, expenditures, debt, and assets. The data presented in this book cover major revenue and expenditure sources.

Programs, like Medicaid, are not reported separately and therefore are not shown separately in the handbook. As for revenues, the handbook only describes general fund revenues; it does not include special revenue funds, such as utility and liquor store revenues. The data are based on fiscal years ending on June 30, 1991, which is characteristic of most state and local governments.

State/Local Tax Rates

Sources: Commerce Clearing House, State Tax Guide, (Chicago, 1992-3), the Advisory Commission on Intergovernmental Relations, Significant Features of Fiscal Federalism, Budget Processes and Tax Systems, volume 1, February 1993, and the Tax Rates and Tax Burdens in the District of Columbia: A Nationwide Comparison, June 1993, D.C. Government, Department of Finance and Revenue.

Real property tax rates of the most populous cities were obtained from the District of Columbia's publication on tax burdens while the other tax rate data were taken from the other publications mentioned above. If a local government(s) levies a tax, it is footnoted in the fiscal section of the handbook. In contrast to "nominal" property tax rates, which are the "announced rates" by local governments, the handbook reports "effective" property tax rates. The effective rates take into consideration the various assessment levels, such as 15 percent of market value, so comparisons can be made.

Tax Capacity and Tax Effort Indexes

Source: Advisory Commission on Intergovernmental Relations, State Revenue Capacity and Effort, RTS 1991, September 1993.

Tax capacity represents the amount of revenue each state would raise if it applied a national average set of tax rates to 27 commonly used tax bases. Since the average rate is the same, for each state, overall, a high tax capacity means that a state

has higher aggregate tax bases, e.g., gross receipts for sales taxes, than the national average.

A state with a high tax capacity will likely have a relatively healthier economy and will probably not be under as much pressure to raise tax rates, expand its tax base, or reduce its expenditures compared with states having relatively low tax capacities. In Table 27, this handbook provides per capita tax capacity indexes, which equal the state per capita tax capacity divided by the per capita tax capacity average for all states, with the average set at 100.

A state with a per capita tax capacity index of 110 means its per capita revenue-raising capacity is 10 percent above the national average. A low tax capacity index may suggest that a state should consider expanding its tax base, e.g., taxing services, and/or suggest a weak economic base.

Tax effort represents the ratio of a state's actual tax collections to its tax capacity. High tax effort states tend to have higher tax rates compared to the national average. It is another tax burden measure, like per capita tax measures.

Similar to the tax capacity index, this handbook provides tax effort indexes equal to each state's tax effort divided by the average tax effort for all states. The interpretation of tax effort indexes is similar to the interpretation of tax capacity indexes. For example, an index of 110 means the state's tax effort is 10 percent above the national average.

One application of tax capacity and tax effort indexes can be shown with the state of Alabama. For 1991, Alabama had a per capita tax capacity index of 81 and a tax effort index of 81. The per capita tax capacity index of 81 suggests that, compared to the national average, Alabama's tax base is 19 percent lower than the national average for the combined total of all 27 commonly used tax bases. Further examination shows that the low per capacity tax index can be partially explained by Alabama's low per capita capacity index of 71 in personal income taxes and 73 in property taxes. This suggests that, compared to the national average, Alabama has a lower personal income tax base and property tax base from which to collect tax revenue. This may mean that Alabama grants many income tax and property tax exemptions.

When a state, like Alabama, has a low per capita tax capacity index due to a narrow tax base, it may have to raise tax rates above the national average. However, Alabama has an overall tax effort of only 81 suggesting that its tax rates are low compared to the national average. This can be partially explained with a property tax effort of 35 which is 65 percent below the national average.
